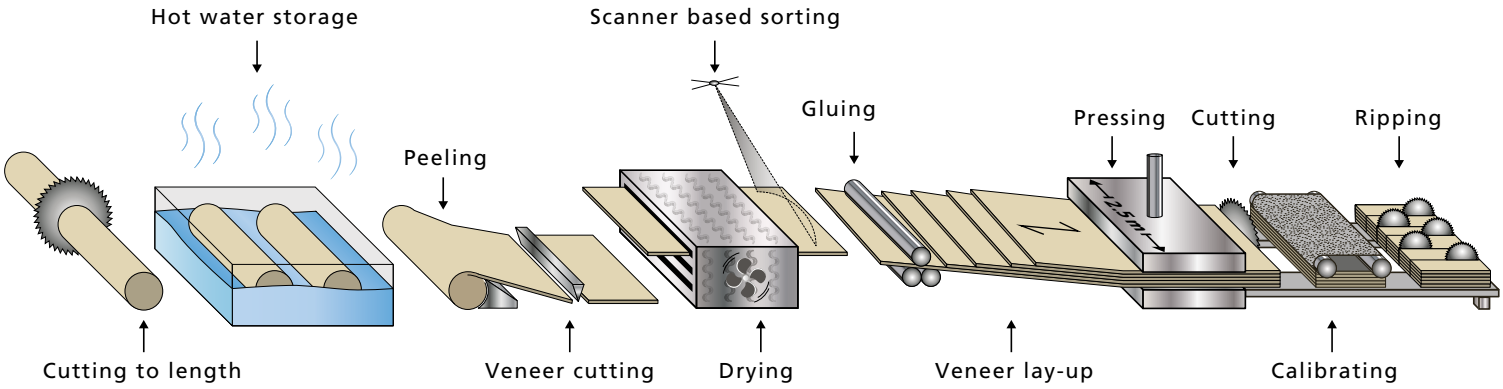
STEICO
engineered by nature

STEICO *LVL* / Laminated Veneer Lumber

Dimensional stability, high strength and load bearing capacity

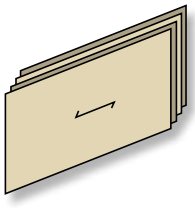
STEICO *LVL* is one of the most stable engineered wood products. It consists of several layers of approx. 3 mm thick, glued softwood veneers (spruce/pine). Defects are evenly distributed resulting is a nearly uniform cross section. This structure gives STEICO *LVL* maximum strength.



DRY	SORTED	HOMOGENEOUS	GLUED	DENSIFIED	VERSATILE
No drying shrinkage because STEICO *LVL* is made with a moisture content of approx. 9 % (corresponds to in-use equilibrium moisture).	A high-performance material from automated testing and strength grading of every single veneer.	Uniform strength throughout, since defects like knots are limited to a single sheet of veneer.	Dimensional stability due to waterproof bonding – no twisting, no shrinkage, absolutely straight components.	Higher strength compared to softwood due to densification during pressing.	Large-format production allows the cutting of all sizes, sticks and panels.

STEICO *LVL R*

Laminated Veneer Lumber



STEICO *LVL R* components consist of veneers that are all bonded in longitudinal layer orientation. Powerful wood material for beam and stud applications.

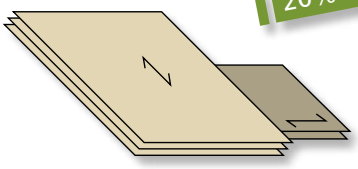
APPLICATIONS

- Floor joists
- Rafters
- Main beams
- Studs
- Sole and top plate
- Lintels
- Beam reinforcements

and many more

STEICO *LVL X*

Laminated Veneer Lumber with cross-layers



STEICO *LVL X* components consist of veneers where approximately one-fifth are bonded in cross-orientation increasing the load-carrying capacity when used as panels as well as the dimensional stability and rigidity.

APPLICATIONS

- Rimboards
- Load-bearing walls
- Roofs and ceilings
- Trusses
- Roof overhangs
- Curved components

and many more

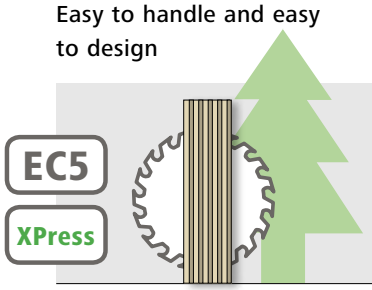
CE

Allgemeine bauaufsichtliche Zulassung **Z-9.1-842**

CERTIFIED COMPONENT Passive House Institute

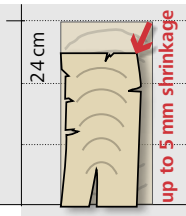
The product for highest requirements in timber construction

Easy to handle and easy to design



STEICO *LVL* consists of softwood veneer and is easy to process - pre-drilling of fasteners is not necessary. The design is carried out according to EC 5 / AbZ Z-9.1-842. The design software Xpress is available at STEICO.

Dimensional stable

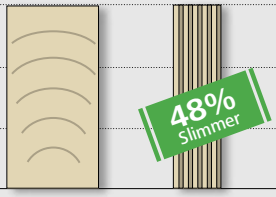


Timber C24

STEICO *LVL X*

STEICO *LVL X* has the smallest swelling and shrinkage under the common engineered wood products. Drying shrinkage is avoided thank to the production moisture content of approx. 9%.

High strength

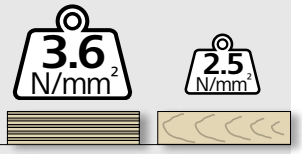


Timber C24 / Glulam 120 mm
$f_{m,k} = 24\ N/mm^2$

STEICO *LVL R* 63 mm
$f_{m,0,edge,k} = 44\ N/mm^2$

High-strength cross sections allow for slender structures - or significantly stronger structures when compared to the same cross sections out of solid wood.

Extremely resistant



STEICO *LVL R*

Timber C24 / Glulam

Extreme resistance where it matters most such as sole and top plates. Not only is material and weight reduced, but also compression settlements are avoided.

Characteristic strength and stiffness properties (N/mm²) for STEICO *LVL* for design according to EC 5

The characteristic density of STEICO *LVL R* and STEICO *LVL X* is 480 kg/m³.	STEICO *LVL R*		STEICO *LVL X* *	
	Flatwise loading	Edgewise loading	Flatwise loading	Edgewise loading
Bending II to the grain $f_{m,0,k}$ / ⊥ to the grain $f_{m,90,k}$	50.0 / –	44.0 / –	36.0 / 8.0	32.0 / 8.0
Tension II to the grain $f_{t,0,k}$	36.0	36.0	18.0	18.0

Shear $f_{v,k}$	2.6	4.6	1.1	4.6
Modulus of elasticity II to the grain $E_{0,mean}$ / ⊥ to the grain $E_{90,mean}$	14,000 / –	14,000 / –	10,600 / 2,500	10,600 / 3,000

* Values for 27 mm ≤ t ≤ 75 mm. A complete overview of the values can be found on p. 26.

Up to 67% material saving

Due to the higher strength and stiffness properties of STEICO *LVL R* when compared to solid softwood products, significant material savings are obtained.

Equivalent cross-section widths:

- Smaller sections due to higher strength properties
- Lighter components thanks to material savings
- Easier handling thanks to reduced cross section widths (E.g. using smaller circular saws)

The following table shows the dimensions and material savings of STEICO *LVL* when compared to other building materials. As the basis for this comparison for beams with a constant height of 240 mm, solid wood of class C24 is used and compared to glulam GL 24c and STEICO *LVL R*. The width varies according to the material-saving potential.

	Solid Timber C24			Glulam GL 24c			STEICO *LVL R*		
	Height h=240 mm 			Height h=240 mm 			Height h=240 mm 		
	Property	Width	Material savings	Property	Width	Material savings	Property	Width	Material savings

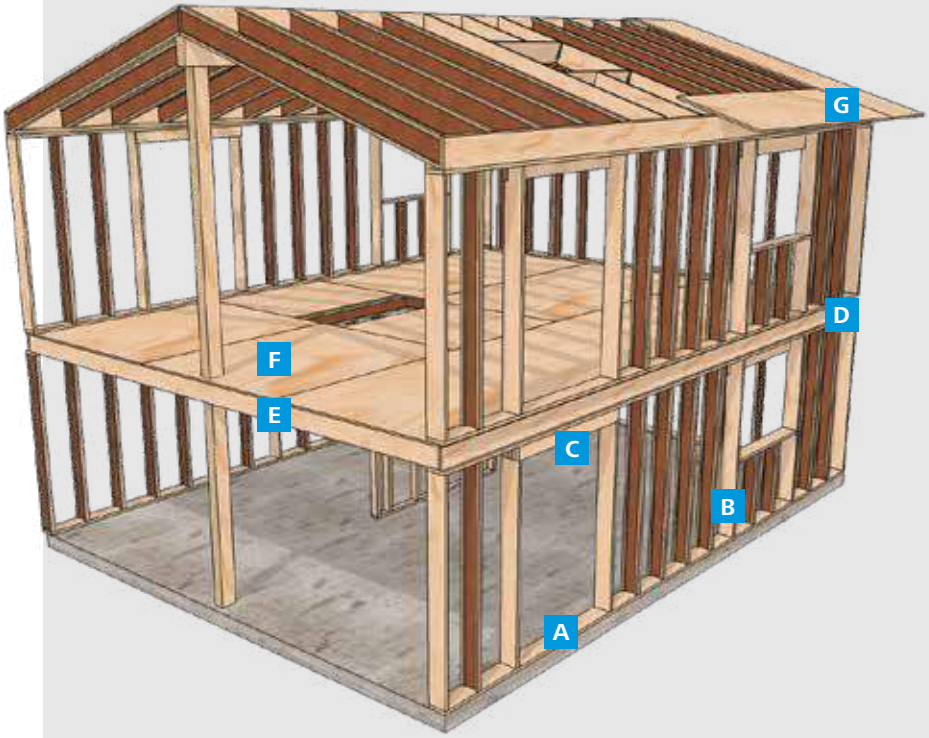
* In considering of correction factors

STEICO *LVL* – Range of applications

Range of Applications



STEICO *LVL* is a high-strength versatile material. In the following, selected fields of application in housing construction are presented as well its advantages and detailed design guidance.

Future-oriented material in a trend-setting building system

The more demanding the requirements, the better its suitability – STEICO *LVL* is the high-performance material for innovative wood construction. Together with the other components of the STEICO product family (I-joists and natural insulating materials), a complete range for structural and insulating building envelope materials is available for wood construction – a complete house from one source. That's the STEICO Natural Building System.

Laminated Veneer Lumber: STEICO *LVL*

I-joists STEICO*joist* and STEICO*wall*

Rigid and flexible wood-fiber insulation

Wood fiber and cellulose air injected insulation

Sealing system for the building shell

Sole and top plates: extreme resistance, prevention of settlements

Walls in wood frame construction can be optimized in many areas through the use of STEICO *LVL* as sole and top plates. Due to the high compressive strength perpendicular to the grain, stud cross-sections can be reduced in both exterior and interior walls and sole-plates can be extended beyond the edge of the concrete slab.

Advantages at a glance

Compressive strength perpendicular to the grain in-plane, flatwise applications 1

- STEICO *LVL R*: $f_{c,90,flat,k} = 3.6$ N/mm²
- STEICO *LVL X*: $f_{c,90,flat,k} = 4.0$ N/mm²

Optimum utilization of wood / reducing wood consumption

- Reduced cross-sections of highly loaded studs, e.g. next to windows
- Increased useable living space through reduced indoor wall depth
- Optimal in combination with STEICO I-joists

Optimized socket detail 2

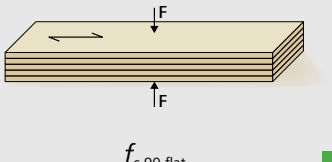
- Possibility for extended walls
- Creation of drip edges
- Economic construction with thin render boards

Sole plates without the use of chemical wood protection

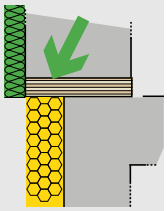
- Use class 0 (GK0) in accordance with DIN 68800-2 – no risk due to moisture or insect infestation, thus no chemical wood protection necessary
- Wood protection by design in accordance with DIN 68800-2 must be applied
- Use of STEICO *LVL* similar to solid softwood members

Reduction of sole plate height from 60 mm to 45 mm 3

- Saving material
- Minimising heat bridges
- Reducing compression perpendicular to the grain settlements
- Two part shear anchors for soleplate heights from 45 mm, for example from Simpson Strong Tie®, are available.

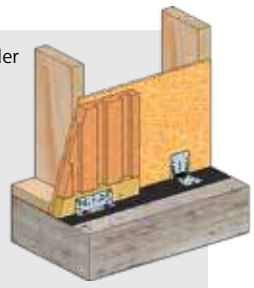


1



Extended walls with STEICO *LVL* sole plates. The connection detail to the wall insulation (drip edge) is possible with thin render boards.

2



Structures with slender soleplates using STEICO *LVL*. Shear anchors with 2-part shear bracket eg. SC2P from Simpson Strong Tie® or Shear brackets on timber batten within service void.

3

STEICO *LVL* as sole and top plates

Preliminary design of STEICO *LVL R* sole and top plates

The table contains the maximum loads for STEICO *LVL R* sole plates, considering the following boundary conditions:

- For load-bearing exterior walls, the detail can extend up a maximum of half the stud depths beyond the load-carrying floor below. Only the supported section is considered for the design check
- Studs in the end-section of the sole plate are to be checked separately
- Alternatively, STEICO *LVL X* can be used

Type	Stud depth	Characteristic resistance per post

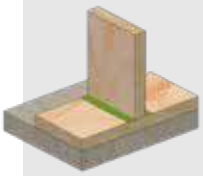
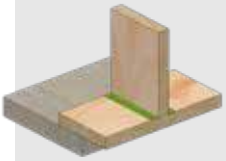
	220	166.3	83.2
	240	181.4	90.7



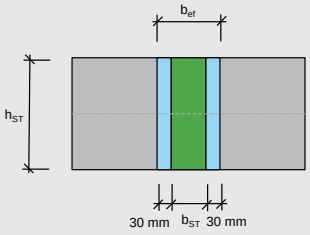
Full support, equally valid for exterior and interior walls.

1



Half support, exterior walls with extended construction.

2



The bearing check is carried out with a $k_{c,\,90}$ value of 1.25 as for solid wood. In addition, the increase factor for the service class 1 according to German approval AbZ Z-9.1-842 is set to 1.20.

General notes

These tables are to be used for preliminary design and do not replace a static design check. The design value of the compressive strength is calculated as: N_d = Table-value (R_K) * k_{mod} / γ_m. The characteristic values on page 26 are to be used for individual design checks.

Wall Studs: high-capacity, slims posts

Due to the high strength and stiffness of STEICO *LVL R*, the stud cross-sections for walls in wood frame construction can be reduced, respectively higher loads can be carried. Wall studs from STEICO *LVL R* are thus well suited for highly loaded components such as studs next to window openings or in load-bearing interior walls.

Advantages at a glance

Compressive strength parallel to the grain 1

- STEICO *LVL R*: $f_{c,0,k}$=40.0 N/mm²

High load-carrying capacity

- Ideal for heavily loaded studs such as next to window openings
- Even small stud cross-sections can carry high loads
- Straight product, thus improved imperfection reduction factor of β_c= 0.1 (measure of eccentricity)

Slender interior walls 2

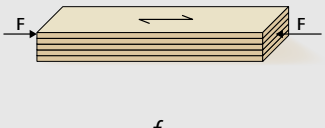
- Reduced wall depth, thus gains in usable space and increase of the real estate value

Technically refined product

- Dry, dimensionally stable, thus no risk of shrinkage cracks
- Form stable components, thus large wall depths possible
- Permanently straight, thus benefits during use

Other advantages of STEICO *LVL R* as a wall stud

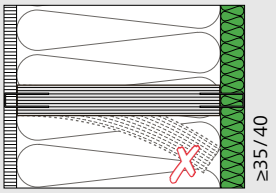
- Reduced cross-sections for minimized thermal bridges
- Matched to the height of STEICO I-joists



$f_{c,0}$

1

Reduction of buckling and lateral torsional buckling risk.



- Interior side: stabilisation through panels (OSB or gypsum board).
- Exterior side: stabilisation through STEICO*universal* or STEICO*protect H*.

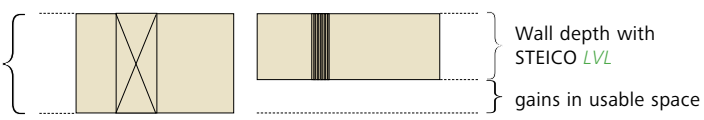
Slender interior walls with STEICO *LVL* 2



STEICO *LVL R* for wall studs

Preliminary design of STEICO *LVL R* as a wall stud

The table contains the maximum loads (axial pressure) for STEICO *LVL R* wall studs, considering the following boundary conditions:

- The table shows a full stud support for exterior or interior walls and a half support for extended exterior walls.
- Buckling: The loaded studs are supported in-plane of the wall, means the table values only consider bending (and buckling) about the strong axis of the stud (Euler buckling case 2 | $\beta = 1{,}0$ | $L_{ef} = h$).
- The design check for compression perpendicular to the grain can be done using the table on page 7.

Type	Stud depth	Characteristic resistance per stud

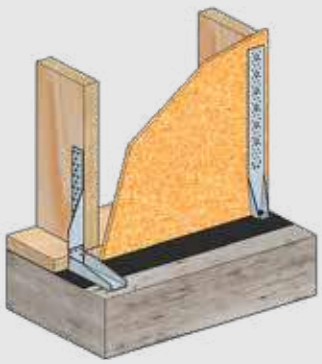
	280	786.7	701.7	393.4	350.8
	300	853.3	784.3	426.7	392.2

General notes

These tables are to be used for preliminary design and do not replace a static design check.
The design value of the normal strength is calculated as: N_d = table-value (R_k) * kmod / γ_m.
The table considers a simply supported element (Euler buckling case 2).
The characteristic values on page 26 are to be used for individual design checks.



Structures with slender wall studs using STEICO *LVL R*. Calculation tables and installation instructions for tension tie HTA and Vplus from the company Würth are available. Two-part tension tie e.g. HD2P from Simpson Strong Tie®.

STEICO *LVL R* for wall studs

Design example wall stud

System

Wall height H_{wall} = ... 3.00 m
Support condition = ... Full support
Stud width b = ... 45 mm
Stud depth h = ... 200 mm

Loads

$F_{k,\ perm}$ = ... 40.0 kN
$F_{k,\ med}$ = ... 20.0 kN

Design loads

$N_{d,\ med} = \gamma_G * N_{k,\ perm} + \gamma_Q * N_{k,med} =$
$1.35 * 40.0 + 1.5 * 20.0 = 84.0$ kN

$N_{d,\ perm} = \gamma_G * N_{k,\ perm} =$
$1.35 * 40.0 = 54.0$ kN

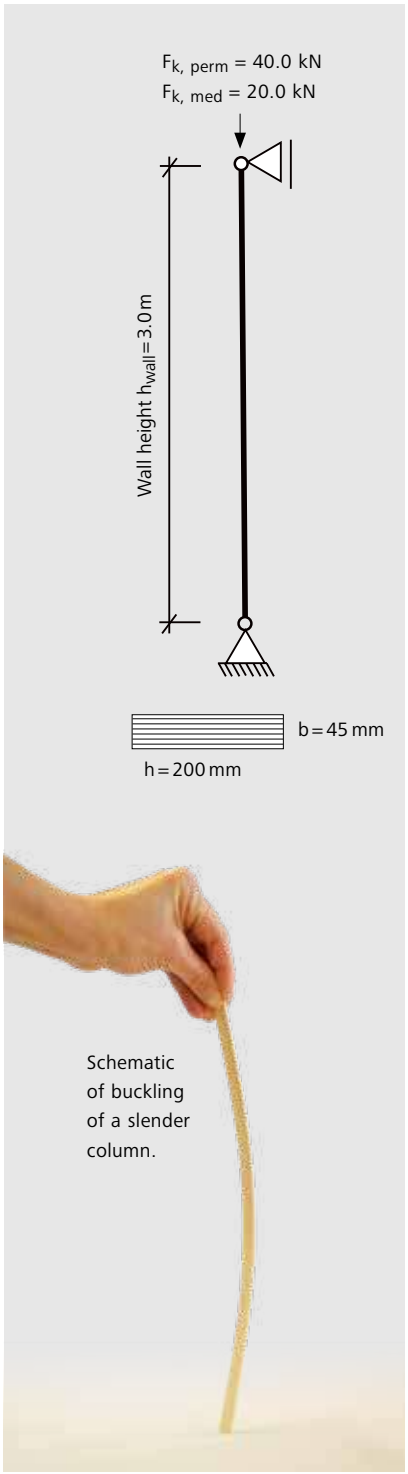
Design check

Bending (buckling) about the strong axis (y-axis):
R_k=289.2 kN (see table on page 9)

$$\eta_{med} = \frac{N_{d,\ med}}{\frac{R_{k,y} * k_{mod,\ med}}{\gamma_M}} = \frac{84{,}0}{\frac{289.2 * 0{,}8}{1.3}} = 0.47 \leq 1.0$$

$$\eta_{perm} = \frac{N_{d,\ perm}}{\frac{R_{k,y} * k_{mod,\ const}}{\gamma_M}} = \frac{54{,}0}{\frac{289.2 * 0.6}{1.3}} = 0.40 \leq 1.0$$

For wind load on the exterior wall, the design check according to clause 6.3.2 of EN 1995-1-1 (equation 6.23) has to be done.



Buckling coefficients k_c for STEICO *LVL R*

For the simplified design check of STEICO *LVL R* stud cross-sections, the buckling coefficients k_c are tabulated as a function of slenderness λ. The buckling check has to be according to clause 6.3.2 of EN 1995-1-1

Buckling coefficients kc for STEICO *LVL R* according to EN1995-1-1: 2010-12 clause 6.3.2

Slender wall studs STEICO *LVL R*

Stud with solid timber C 24

Stud with STEICO *LVL R*

* According to the expert opinion of Univ. Prof. Dr.-Ing. H. J. Blaß from 23.04.2018, Adoption of rules into General Building Approval Z-9.1-842 for STEICO *LVL* Laminated Veneer Lumber applied for.

Material- and thermalbridge reduction using slender STEICO *LVL R* wall studs

The use of high load bearing STEICO *LVL R* wall studs, in combination with STEICO *LVL* sole plates, can result in significant material savings. This is made possible due to the high compression and bending strength of Laminated Veneer Lumber. The following table shows the material saving potential of using STEICO *LVL R* Laminated Veneer Lumber instead of wall constructions which utilize solid C 24 timbers.

	Solid timber C 24 for wall studs and sole / header plate	STEICO *LVL R* for wall studs and sole / header plates			
		Middle stud 1		Edge stud 2

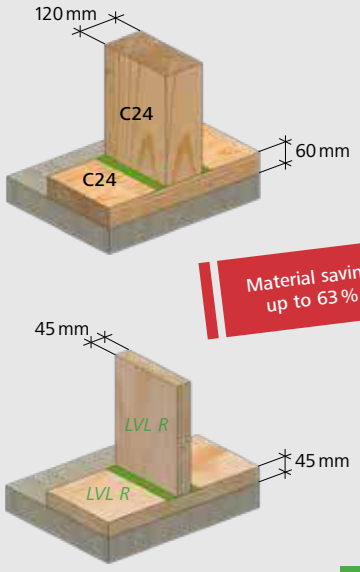
	120	45	63 %	57	53 %
	140	57	59 %	75	46 %
	160	75	53 %	45 + 45	44 %
	180	45 + 45	50 %	57 + 45	43 %
	200	57 + 45	49 %	57 + 57	43 %

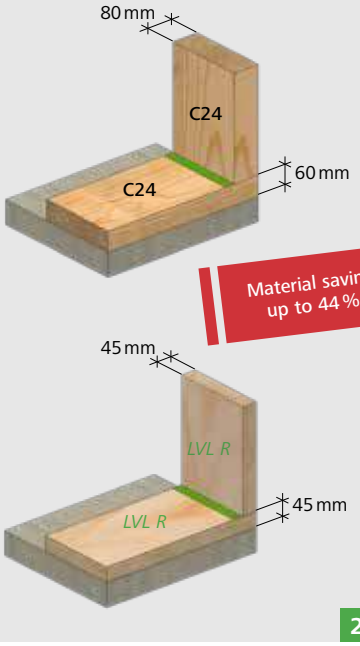
General information

From a stud depth of 120 mm the compression of the sole plate is critical (Examined Buckling length 3,0 m, in a braced wall). The bearing check uses a $k_{c,90}$-value of 1,25 the same as solid timber. The increase factor for $f_{c,90,flat,k}$ in SC1 in accordance with AbZ Z-9.1-842 with k = 1,20 was used. The increased contact length in accordance with DIN EN 1995-1-1 in considered with 30 mm on both sides of a middle stud and 30 mm on an edge stud.

Middle stud



Edge stud



Example calculation for wall stud

Solid Timber C 24: 120 mm * 200 mm

Sole plate compression (middle stud):

$R_{SWP,C24,k}$
$= f_{c,90,k} * A_{ef} * k_{c,90}$
$= 2,5 * 200 * (30+120+30) * 1,25$
$= 112,5$ kN

Buckling:

$R_{buckling,C24,k} = 388,9$ KN $\geq 112,5$ kN
→ *Buckling not critical*

STEICO *LVL R* 45 mm * 200 mm

Sole plate compression (middle stud):

$R_{SWP,LVLR,k}$
$= f_{c,90,flat,k} * A_{ef} * k_{c,90} * k$
$= 3,6 * 200 * (30+45+30) * 1,25 * 1,20$
$= 113,4$ kN $\geq 112,5$ kN ✓

Buckling:

$R_{buckling,LVLR,k} = 289,2$ KN $\geq 113,4$ kN
→ *Buckling not critical*

Advantages of slender STEICO *LVL R* wall studs

- Up to 63 % less timber used
- Reduced cross section with minimal thermal bridge
- One product for sole plate and stud hence less stock requirement
- Up to 10 % saving in fixings due to 37 % higher embedment strengths
- Dry, stable material for accurate construction
- Reduced timber material for robust construction

C STEICO *LVL R* as lintel

STEICO *LVL R* lintels for maximum loads

Traditional connections and details for lintels can be optimised through the use of STEICO *LVL* statically as well as in regards to building physics. Using intelligent design, filigree members can be used, which offer multiple advantages.

Advantages at a glance

Bending strength and elastic modulus parallel to the grain with edgewise application 1

- STEICO *LVL R*: $f_{m,0,edge,k}$ = 44.0 N/mm²
- STEICO *LVL R*: $E_{0,mean}$ = 14,000 N/mm²

Compressive strength perpendicular to the grain with edgewise application 2

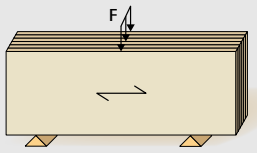
- STEICO *LVL R*: $f_{c,90,edge,k}$ = 7.5 N/mm²

Lintel details for large wall depths a/b

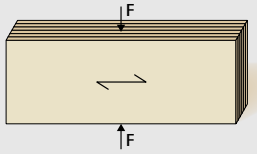
- Lintels in addition to shading
- Studs can be interrupted
- Slim lintels, static height optimized
- Design as single span or multiple-span beam
- Reduced material usage
- Improved detailing in regards to building physics

Lintel details for small wall depths c

- Exchange of steel beams without design changes
- Simpler details when compared to using steel beams
- Reduced section height compared to glued laminated timber members
- Reduced bearing lengths compared to glued laminated timber (reduced stud cross section)
- Design as single span or multiple-span beam
- Block-laminated STEICO *G LVL R* beams or mechanically jointed multi-part STEICO *LVL R* beams possible

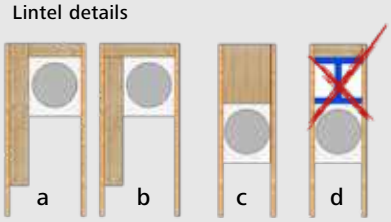


$f_{m,0,edge}$ and $E_{0,edge}$ 1



$f_{c,90,edge}$ 2

Lintel details



a/b: Lintel details for large wall depths as single span or multiple-span beam

c: Lintel details for small wall depths

d: Lintel detail using steel beams – not desirable in wood construction

Multi-part STEICO *LVL R* beams, mechanically connected 1

- For uniformly distributed loads, it is sufficient to connect the individual STEICO *LVL R* strips with nails, screws or dowels.

Multi-part STEICO *LVL R* beams

Uniformly distributed loads from floor beams

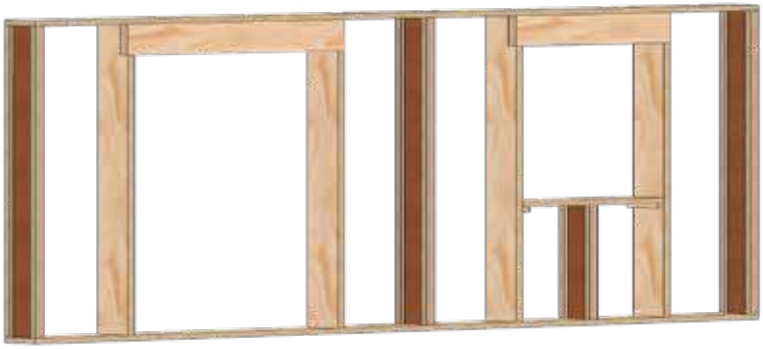
Design examples

a ***STEICO** LVL R lintel installed edgewise as a single-span beam*

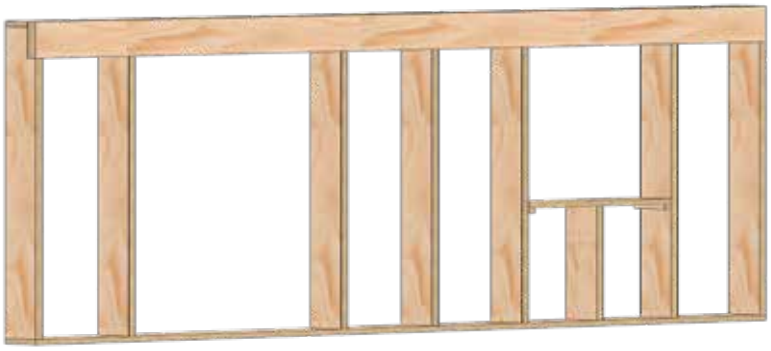
- Lintel as a single-span beam just over the openings
- Wall studs without notches in areas without openings



Notched stud with continuous lintel

b ***STEICO** LVL R lintel installed edgewise as multi span beam*

- Continuous lintel as multi span beam
- floor joists spacing independent of the wall stud locations



Notched stud with continuous top plate and lintel

c ***Glued multi-part STEICO** G LVL R lintel as continuous beam*

- Lintel as a single-span or multi-span continuous beam
- Floor joists spacing independent of the wall stud locations

Glued multi-part STEICO *G LVL R* lintel as continuous top plate

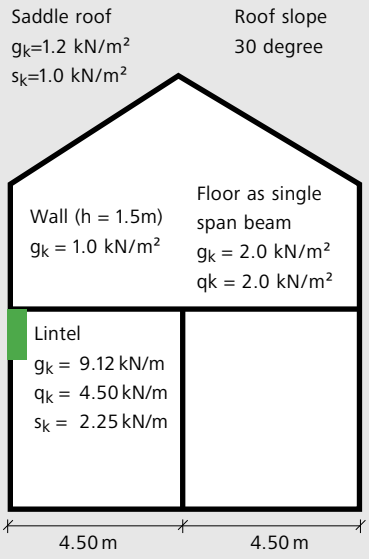
STEICO *LVL R* as lintel

Preliminary design of STEICO *LVL R* as lintel

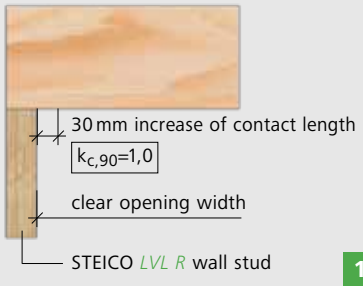
Based on the reference building for the variant **a** (STEICO *LVL R* as wall lintel installed edgewise as a single-span beam) the STEICO *LVL R* lintel is designed. The table shows the maximum clear opening and the required bearing length (depth of stud at the opening).

Beam width [mm]	Beam height $h_{Träger}$ [mm]	Lintel installed edgewise as a single-span beam	
		Maximum clear opening l [m]	Required bearing length l_A [mm]
STEICO *LVL R* b = 1*45 mm	200	1.45	45
	240	1.75	57
	280	2.05	75
	300	2.20	80
STEICO *LVL R* b = 1*57 mm	200	1.60	45
	240	1.95	45
	280	2.30	60
	300	2.45	75
STEICO *LVL R* b = 1*75 mm	200	1.80	45
	240	2.15	45
	280	2.55	45
	300	2.70	57
STEICO *LVL R* b = 2*45 mm	200	1.95	45
	240	2.35	45
	280	2.75	45
	300	2.90	45
STEICO *LVL R* b = 2*57 mm	200	2.10	45
	240	2.55	45
	280	3.00	45
	300	3.20	45
STEICO *LVL R* b = 2*75 mm	200	2.35	45
	240	2.80	45
	280	3.30	45
	300	3.55	45

reference building



STEICO *LVL R* lintel



1

Support condition 1

The design check in the lintel section on the wall stud will be done out with a $k_{c,90}$ value of 1.0. The bearing on the sole plate and the buckling of the stud have to be checked separately, see tables on pages 7 and 9. For two-part lintels, the load has to be equally transferred to both parts.

Boundary conditions

Service class = 1
Live load:
Category A (Load duration class = medium)
Snow load: the building is
≤ 1000 m above sea level
(Load duration class = short)

Serviceability Limit State check (SLS):

Done in accordance with clause 7.2 of DIN EN 1995-1-1.

Deflection limits are based on:

w_{inst} ≤ l/400
$w_{net,fin}$ ≤ l/400
w_{fin} ≤ l/300

In certain cases, where these limits might be too generous, we recommend that you make specific arrangements with the owner in advance.

Ultimate Limit State check (ULS):

Checks for bending and shear according to DIN EN 1995-1-1. It is assumed that the compression side is supported to prevent buckling. The tables and its valued do not substitute the static design check.

STEICO *LVL X* as rimboard: Prevention of settlements at storey interface

In order to avoid compression wrinkles in the facade, settlements at storey interfaces must be prevented constructively. The use of STEICO *LVL X* as rimboard reduce the amount of wood in compression perpendicular to the grain and ensure a perfect load transfer. In combination with a slender STEICO *LVL* sole an top plate, a highly resilient and dimensionally stable interface is generated, which prevents any settlement.

Advantages at a glance

Compressive strength perpendicular to the grain in edgewise application: 1

- STEICO *LVL X*: $f_{c,90,edge,k} = 9.0$ N/mm²

Swelling and shrinkage

- Delivery moisture content = Equilibrium moisture content at use, thus no shrinkage and swelling
- With STEICO *LVL X* approx. 20 % of the veneer layers are vertical
- Dimensionally stable component

Avoiding settlements

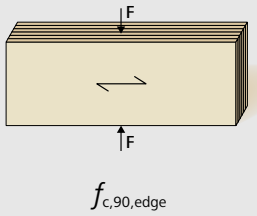
- High compressive strengths in edgewise application
- Very small compression (high compression modulus of elasticity)
- Secure load transfer thanks to cross-wise veneers
- No settlements, thus compression wrinkles in the facade are prevented

Reduced cross section 2

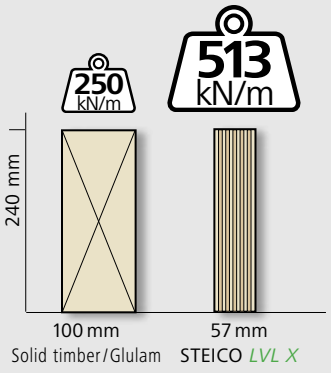
- Due to the high compressive strength, the cross-section can be significantly reduced compared to solid timber of strength class C24

Further advantages of STEICO *LVL X* as rimboard

- Rimboard to prevent tilting of joists
- Can be connected in the edge face
- No rimboard splicing required
- Continuous rimboard required for diaphragm behaviour (absorption of tensile forces from the floor)
- Optimal in combination with slender STEICO *LVL* sole and top plates (reduction of wood loaded perpendicular to the grain)



1



"Half the cross-section – twice the load-carrying capacity"

1 meter rimboard made of solid timber C 24 resp. Glulam (all classes) with a cross-section 100/240 mm has a characteristic compression capacity of 250 kN/m. The strength and stiffness of STEICO *LVL X* due to the cross-wise veneer layers is significantly higher. A STEICO *LVL X* rimboard with a width of only 57 mm can carry 513 kN/m.

2

STEICO *LVL X* as rimboard

STEICO *LVL X*: Design advantages though direct floor support

Comparison between balloon-type construction (C24/Glulam) and construction with direct floor support (STEICO *LVL X*)		
	Balloon-frame construction (C24/Glulam)	Direct floor support with STEICO *LVL X* rimboard
		Simple and cost-effective fastening technology	✖	✔
Sound insulation	✖	✔
Same internal and external wall heights, thus same panel sizes and stud length	✖	✔
Cost savings through possible avoidance of installation level	✖	✔
Direct support for "simple" load transfer	✖	✔
Air tightness	✔	✔
Dimensional stability	✔	✔
Effort	**High**	**Low**

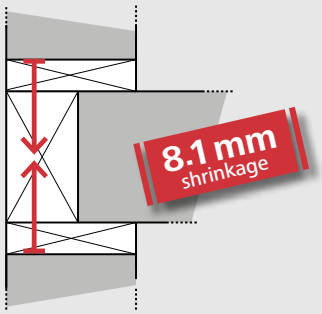
Platform-type construction offers a significantly more economical solution for timber houses. The mounting of floor elements on the wall element can be realized more efficiently, the direct bearing also permits designing for a simpler load path. This type of construction is also superior in terms of sound insulation.

STEICO *LVL X*: Highest safety for timber construction

Comparison of different wood products when used as rimboard			
	Solid timber C24	Glued laminated timber (all classes)	STEICO *LVL X* Laminated Veneer Lumber
			Compressive strength perpendicular to the grain	2.5 N/mm² 100%	2.5 N/mm² 100%	9.0 N/mm² 360%
Wood moisture content at delivery	up to 18%	up to 15%	approx. 9%
Possible shrinkage for cross-section height of 300 mm	up to 7 mm	up to 5 mm	0 mm
Swelling and shrinkage coefficient in % for 1 % change of wood moisture content (lower = better)	0.25	0.25	0.03
Processing without pre-drilling	yes	yes	yes
Free weathering during the construction phase	yes	yes	yes
Suitable as rimboard	**With restrictions**	**With restrictions**	**yes**

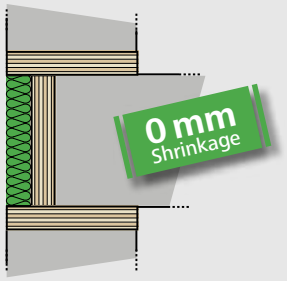
STEICO *LVL X* as rimboard combines dimensional stability, high strength and easy processing – STEICO *LVL X* is therefore the best choice for modern timber constructions with the highest precision.

Solid timber C 24 – Significant shrinkage



Height of rimboard (C24)	240 mm
Depth of sole an top plate of the adjacent wall elements (C24)	60 mm
Permissible wood moisture content at delivery	**up to 18%**
Swelling and shrinkage coefficient in % for 1 % change of wood moisture content	**0.25**
Equilibrium moisture content during use	approx. 9%
Change of moisture content	**–9%**
Shrinkage	**up to 8.1 mm**

STEICO *LVL X* – completely dimensionally stable



Height of rimboard (*LVL X*)	240 mm
Depth of sole and top plate of the adjacent wall elements (*LVL X/R*)	45 mm
Permissible wood moisture content at delivery	**approx. 9%**
Swelling and shrinkage coefficient in % for 1 % change of wood moisture content	**0.03**
Equilibrium moisture content during use	approx. 9%
Change of moisture content	**0%**
Shrinkage	**0 mm**

Floor structures with STEICO *LVL*: Economical, wide-span floor structures

The use of STEICO *LVL R* enables economic, wide-span floor structures. Thanks to the high strength and stiffness combined with the available slender cross-sections, STEICO *LVL R* is ideally suited for floor applications.

STEICO *LVL* as joist: advantages

Bending strength and longitudinal modulus of elasticity for edgewise application 1

- STEICO *LVL R*: $f_{m,0,edge,k}$ = 44.0 N/mm²
- STEICO *LVL R*: E_{mean} = 14,000 N/mm²

Wide-span floor structures 2

- High stiffness
- High strength

Technically refined product

- Straight product, no pre-deformation
- Dry and dimensionally stable, thus no risk of shrinkage cracks
- Slender cross-sections, thus low weight

Small bearing lengths

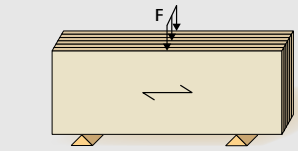
- High compressive strength perpendicular to the grain if used in edgewise application
- Supports in the installation level possible
- Point supports possible without the use of steel plates
- Load bearing dovetailed connection according to the German Technical Approval AbZ Z-9.1-649 possible

Planning security

- STEICO *LVL R* joists are available in many heights, no change of material required as for solid timber (for example, change to glued laminated timber)
- Recommended slenderness = 1/8
  - e.g.: STEICO *LVL R* 75 mm * 600 mm or 45 mm * 360 mm

Joists for heavy floors

- Floors with a natural frequency ≤ 8 Hz are possible
- Special investigations, e.g. According to Information sheet 02.04 by the Federal Association of German Prefabricated Buildings (BDF)
- Larger spans possible If the required boundary conditions are met



$f_{m,0,edge}$ and $E_{0,edge}$

Calculation using STEICO*xpress*

Serviceability Limit State check (SLS):

This check in done in accordance with clauses 7.2 and 7.3 of DIN EN 1995-1-1 under consideration of the German National Application Document (version 2013):

$w_{inst} \leq l / \ldots\ldots 300$
$w_{net,fin} \leq l / \ldots\ldots 300$
$w_{fin} \leq l / \ldots\ldots 200$

Limit frequency for vibration performance (ULS):

$f_{1,\ Limit} > 8.0$ Hz

Ultimate Limit State check (ULS):

One-way bending and shear are considered. Bearing pressure, wind and point loads are not considered in the table values. These tables are to be used for preliminary design and do not replace a static design check.

STEICO *LVL* for floor structures: Advantages

For large-span floors where conventional constructions reach their performance limits, composite floor systems offer an interesting and economical alternative – Composite systems consisting either of STEICO *LVL X* sheathing, STEICO *LVL R* ribs or mass-panel elements from STEICO *G LVL R*.

Composite structures

- Static activation of STEICO *LVL X* sheathing for vertical load transfer
- Stiffening and fast production thanks to large-format STEICO *LVL X* panels
- Wide-span floor construction for flexible, open floor plan design
- Manual production of mechanically joined composite elements using clamps, nails or screws
- Production of glued elements by certified producer, glue certification C 2 according to DIN 1052-10

Composite construction: STEICO LVL X rib elements 1

- Top sheathing: STEICO *LVL X*
- Rib: STEICO *LVL R*
- Composite action: mechanically joined or glued

Composite construction: STEICO LVL box elements 2

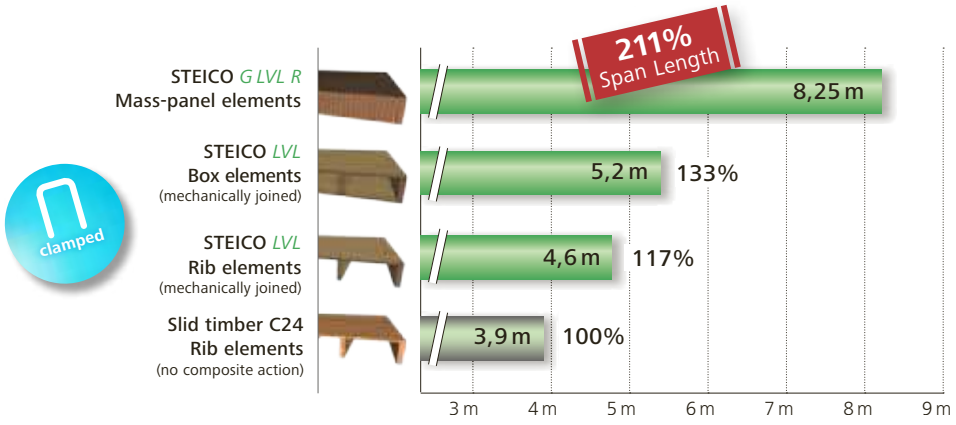
- Top and bottom sheathing: STEICO *LVL X*
- Rib: STEICO *LVL R*
- Composite action: mechanically joined or glued

Mass-panel elements

STEICO G LVL R Solid floor panel 3

- Multiple glued STEICO *LVL R* ribs
- High-strength element for large spans
- Appealing fineline look

Comparision of spans for different floor systems

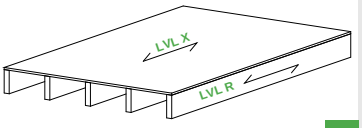


Boundary conditions:
Single-span beams | Service class 1 | Category A | Dead load g_K = 2.20 kN/m² | Life load q_k = 2.0 kN/m² | Limit frequency for vibration performance > 8 Hz | Spacing of the ribs e = 625 mm | Rib height h_w = 240 mm and $h_{LVL\ solid}$ = 280 mm | Rib width $b_{w,\ C24}$ = 60 mm and $b_{w,\ LVL\ R}$ = 57 mm | STEICO *LVL X* sheathing t = 27 mm | Mechanical fasteners: wire clamp d = 2.0 mm, clamp length l = 70 mm, clamp spacing s_{VM} = 30 mm

Manual production

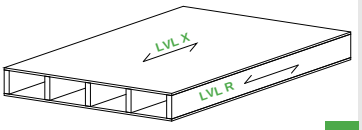
Mechanically joined composite elements using clamps, nails or screws. (No glue certification required.)

STEICO *LVL* Rib Elements



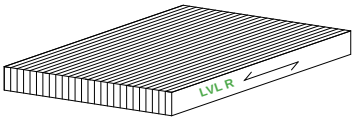
1

STEICO *LVL* Box elements



2

STEICO *G LVL R* Mass-panel elements



Product certified according to German Technical Approval AbZ Z-9.1-870

3

F STEICO *LVL X* as roof and floor diaphragm

Roof and floor diaphragm: high strength and high stiffness

Roof and floor diaphragm made of STEICO *LVL X* are used as load-bearing sheathing and as stiffening diaphragm. Due to the high strength and stiffness in combination with the available dimensions (large format panels) STEICO *LVL X* is exceptionally suitable for these applications. Furthermore, special applications like curved components can be used according to the German technical approval AbZ Z-9.1-842.

Advantages at a glance

Bending strength parallel to the grain and longitudinal modulus of elasticity for upright application (t≥ 27 mm) 1

- STEICO *LVL X*: $f_{m,0,flat,k}$ = 36.0 N/mm²
- STEICO *LVL X*: $E_{0,mean}$ = 10,600 N/mm²

Shear strength when used as diaphragm

- STEICO *LVL X*: $f_{v,edge,k}$ = 4.6 N/mm²

High strength and stiffness 2

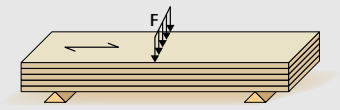
- Increased spacing of joists and purlins
- Improved load-distribution, positive for the vibration performance
- Easy installation of fasteners without pre-drilling

Large format panels available 3

- Widths up to 2.5 m and lengths up to 18 m
- Plate thickness up to 63 mm
- Enables multiple-span systems
- Accelerated installation, less work steps
- Reduction in number of plate joints

Further advantages of STEICO *LVL X* as roof and floor diaphragm

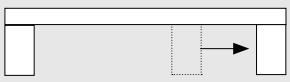
- Dimensional stability through approx. 20 % cross-wise layers
- Reduced creep compared to OSB and particle boards



$f_{m,0,flat}$ and $E_{0,flat}$

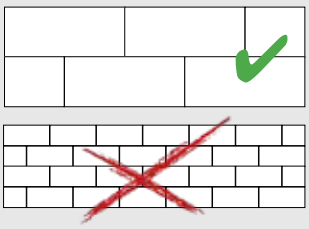
1

Increased spacing of joists and purlins



2

Quick installation thanks to large format panels



Reduction in number of plate joints and accelerated installation with less work steps thanks to large-format panels with widths of up to 2.5 m and lengths up to 18 m.

3

Boundary conditions

Service class = 2

Load duration class = short
(Building height above sea level ≤ 1000 m)

Roof slope: α = 0 degrees

The dead weight of the STEICO *LVL X* panels has already been taken into account and therefore does not have to be added.

For more detailed information on building physics considerations when using veneer laminated wood in a flat roof structure, please refer to the publication "Flat roofs in wood construction" by Informationsdienst Holz.

Serviceability Limit State check (SLS):

These checks are done in accordance with clause 7.2 of DIN EN 1995-1-1 under consideration of the German National Application Document (version 2013):

w_{inst} .....≤ l/200
$w_{net,fin}$..... ≤ l/250
w_{fin} .....≤ l/150

In certain cases, where these limits might be too generous, we recommend that you make specific arrangements with the owner in advance.

Ultimate Limit State check (ULS):

One-way bending and shear as for man-load are considered according to DIN EN 1995-1-1 and DIN EN 1991-1/NA: 2010 Tab. 6.10

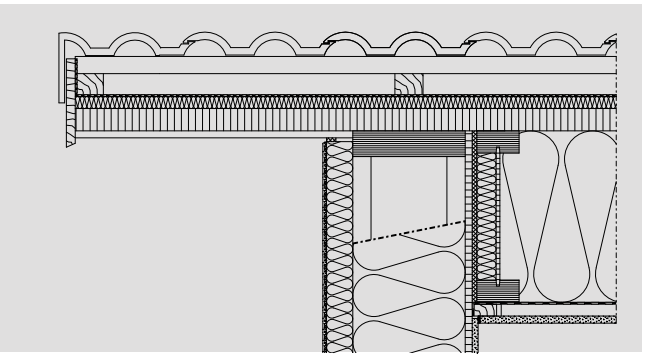
The snow load was reduced by the coefficient μ for roof slopes of 0° ≤ α ≤ 30° and uniformly distributed.

Bearing pressure, wind and point loads are not considered in the table values.

These tables are to be used for preliminary design and do not replace a static design check.

G STEICO *LVL X* as roof overhang

STEICO *LVL X* as roof overhang: slender, elegant and strong



Slender overhangs with fine roof lines can be realized economically and simply with STEICO *LVL X* panels. It is recommended to take the panel orientation and joints into consideration during the design stage. The largest deflections are to be expected at the corner areas, for which special solutions are offered.

Advantages at a glance

Bending strength parallel to the grain and longitudinal modulus of elasticity for flatwise application (t ≥ 27 mm) 1

- STEICO *LVL X*: $f_{m,0,flat,k}$ = 36.0 N/mm²
- STEICO *LVL X*: $E_{0,mean}$ = 10,600 N/mm²

Bending strength perpendicular to the grain and transverse modulus of elasticity for flatwise application (t ≥ 27 mm) 2

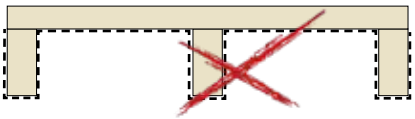
- STEICO *LVL X*: $f_{m,90,flat,k}$ = 8.0 N/mm²
- STEICO *LVL X*: $E_{m,90,flat,mean}$ = 2,500 N/mm²

Architecturally appealing roof detailing

- Fine-line continuous roof lines
- Application for steep and flat roofs
- Large format panel dimensions, reduction of panel joints
- Roof overhangs of up to 2.0 m possible

Connections

- Simple connection details to the façade
- No flying rafters and stillage boards required
- Easy prefabrication
- Additional connections around rafters are omitted



Complex joint detail with solid timber rafter

Simple joint detail with STEICO *LVL X*

Design example

1. Input values: E.g. dead load g_k=0.65 kN/m²; Snow load on the roof s_k= 0.68 kN/m²; Overhang length l_k= 60 cm

2. Define STEICO *LVL X* panel thickness (from tables)

Regular overhang areas with panel spanning in the direction of the strong axis: t = 27 mm,
Regular overhang areas with panel spanning in the direction of the weak axis: t = 33 mm,
STEICO *LVL R* corner reinforcement (from table) t = 33 mm and b = 275 mm

STEICO *LVL X* as roof overhang

Detailing of corner reinforcement

The corner detail is to be designed separately, because here the projection is diagonally measured greater than in the regular areas. As simple measure, a corner reinforcement from STEICO *LVL R* can be used. This reinforcement has the advantage that the regular areas can be used for the design of the overhang and a one-dimensional replacement system can be used for the calculation.

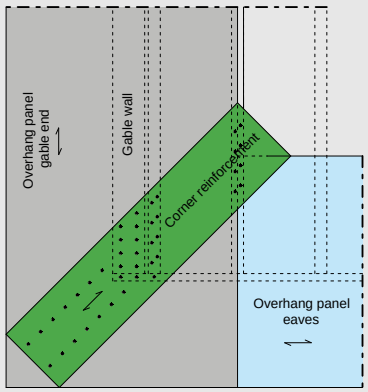
Design recommendation

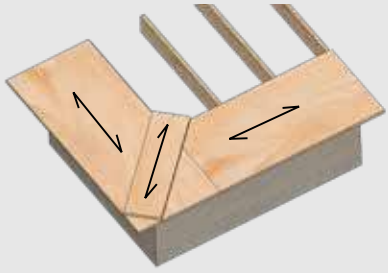
Since overhang structures cool down significantly overnight, STEICO recommends an additional top insulation of the STEICO *LVL X* panels. This minimizes condensation on the underside of the overhang. STEICO*universal* panels can be used for this insulation. Further recommendations are included in the publication 5-2-2 “Wood protection – constructural measures” from German "Informationsdienst Holz" (Timber Information Service).

STEICO *LVL X* is a structural product, the veneers are primarily sorted according to strength criteria, therefore a surface sheathing is recommended.

Refraining from surface sheathing, a coating system is required and should be planned carefully. Information on suitable coating systems is provided e.g. by the company Remmers (transparent or opaque coating available).

Construction of corner reinforcement with STEICO *LVL R*





Thanks to the corner reinforcement with STEICO *LVL R*, a safe load-path is provided in the corner area, without the need to increase the panel thickness in the regular areas.

Boundary conditions

Service Class = 2

Load duration class = short
(Building height above sea level ≤ 1000 m)

Rood slope: α = 0 degrees

Anchoring the overhang: $L_k \leq L_A$

Considered wind load: w_k=0.325 kN/m²

Considered man load: Q_k=1.0 kN

Static system: fixed cantilever

Panel weight is taken into account

Serviceability Limit State check (SLS):

These checks are done in accordance with clause 7.2 of DIN EN 1995-1-1 under consideration of the German National Application Document (version 2013):

w_{inst} ..... ≤ l/150
$w_{net,fin}$..... ≤ l/150
w_{fin}..... ≤ l/100

In certain cases, where these limits might be too generous, we recommend that you make specific arrangements with the owner in advance.

Ultimate Limit State check (ULS):

One-way bending and shear as for man-load are considered according to EN 1995-1-1.

Bearing pressure and connection forces are not considered in the table values.

The table values are valid only for linearly supported panels.

These tables are to be used for preliminary design and do not replace a static design check

Mechanical properties of STEICO *LVL*

Mechanical properties of STEICO *LVL*

The following table summarizes the STEICO *LVL* characteristic strength and stiffness properties in N/mm². In addition, other characteristics of STEICO *LVL R* and STEICO *LVL X* are included. The respective symbols are identified in the figures on the next page.

Main parameters	Symbol	Figure	Unit	STEICO *LVL R*	STEICO *LVL X* (t ≤ 24 mm)	STEICO *LVL X* (t ≥ 27 mm)

Calculation programs for STEICO *LVL* Laminated Veneer Lumber und STEICO*joist* I-Joists

For the structural calculation of building components the designer has numerous design programs available. The following details the various programs available with which both STEICO *LVL* Laminated veneer lumber and STEICO*joist* I-Joists can be calculated.

STEICO*xpress*

STEICO*xpress* is a free structural design program which allows simple and efficient design of STEICO *LVL* and STEICO*joist*. Regardless of whether single or multi span, floor or roof applications, the calculation of STEICO *LVL* and STEICO*joist* can be carried out in a few simple steps. The calculation of service holes is also possible.

There are many other programs alongside STEICO*xpress* which are available. The following programs have both STEICO *LVL* and STEICO*joist* available in their databases.

Software solutions for calculation of STEICO *LVL* and STEICO*joist* I-joists

Software		STEICO *LVL*	STEICO*joist*	Further Information
STEICO*xpress*		✓	✓	www.steico.com
mb AEC Software GmbH NEW		✓	–	www.mbaec.de
Frilo Software		✓	–	www.frilo.eu/de
Harzer Statik Software		✓ 1	✓	www.harzerstatik.de
Dlubal Software		✓	✓	www.dlubal.com
SOFiSTiK		✓ 1	–	www.sofistik.de
VC Master		✓ 1, 2	✓ 1	www.vcmaster.com
PCAE		2	–	www.pcae.de

1) Manual input of material data required
2) Implementation of STEICO *LVL* into database in progress

BauStatik von mb AEC Software GmbH

STEICO *LVL* is available for the user of the mb Work Suite in following applications:

- S110.de/at Wood rafter
- S120.de/at Wood rafter plumb / square cut
- S130.de/at Wood purlin in roof pitch
- S172.de Wood mono pitch binder
- S201.de Wood concrete composite floor
- S202.de Wood vibration check
- S302.de/at Wood continuous, DIN EN 1995-1-1
- S322.de/at Wood continuous, double bending
- S400.de/at Wood column
- S410.de Wood column system, DIN EN 1995-1-1
- S602.de Wood calculation, framework
- S852.de/at Wood calculation, table values

Frilo Software

STEICO *LVL* is available for the user of the Frilo software in following applications:

- H01+ Wall stud (new)
- H011+ Timber calculation (new)
- DLT+ Continuous member (integration in planning)

Harzer Statik Software

STEICO*joist* I-joists can be calculated in the following modules:

- Floor joists
- Floor beams

In addition the user can freely define the material

RFEM und RSTAB von Dlubal

STEICO*joist* I-joists can be calculated in the following modules:

- RF-/LIMITS

STEICO *LVL* is available for the user of RFEM/ RSTAB software from Dlubal in the following modules:

- RF-/HOLZ Pro
- RF-/LIMITS

In addition the user can freely define the material.

Up to 37 % higher hole bearing strength

For the connection design in STEICO *LVL*, the specification of the German technical approval AbZ Z-9.1-842 apply in combination with the requirements according to DIN EN 1995-1-1 for solid timber (STEICO *LVL R*) and plywood (STEICO *LVL X*). Accordingly, nails, screws, clamps, dowels, pins, split-rings and shear plates are allowed.

In contrast to conventional wood-based materials, dowel-type fasteners may also be installed in the edge face of STEICO *LVL*

- STEICO *LVL* consists of softwood and is easy to process
- Installation of nails, screws and clamps without drilling possible
- Due to the high material strength, fewer fasteners with smaller diameters and at larger spacings can be used
- Fasteners may also be installed in the edge face

The table summarizes the modification factors which apply for fasteners used in shear in STEICO *LVL*

	Fastener	STEICO *LVL R*	STEICO *LVL X*
Wide face	Nails, screws, clamps, **not predrilled**	137%	137%
	Nails, screws, clamps, **predrilled**	110%	110%
	Drift pins	110%	110%
Edge face	Nails, screws, clamps, **not predrilled**	96%	55%
	Nails, screws, clamps, **predrilled**	82%	41%
	Drift pins	82%	41%
End face	According to fastener product approval		

The table above is showing modification factors for shear in different applications and compares solid timber C24 to STEICO *LVL*. The modification factors for not pre-drilled fasteners refer to equation 8.15 of DIN EN 1995-1-1, and for pre-drilled fasteners to equation of 8.16.

If specific fastener product approvals include rules for the design in laminated veneer lumber, then these rules may be applied to STEICO *LVL*.

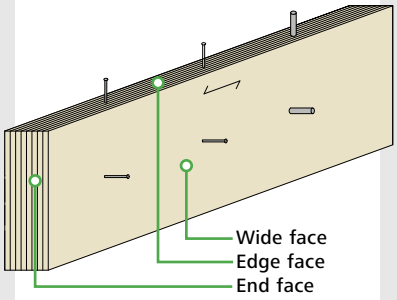
Spacing in STEICO *LVL* 1

The spacings (edge and end distances) are specified in the adjacent drawing as defined by DIN EN 1995-1-1. The minimum spacings can be taken either from DIN EN 1995-1-1 in conjunction with the national application document or from the specific fastener (e.g. screws) product approval.

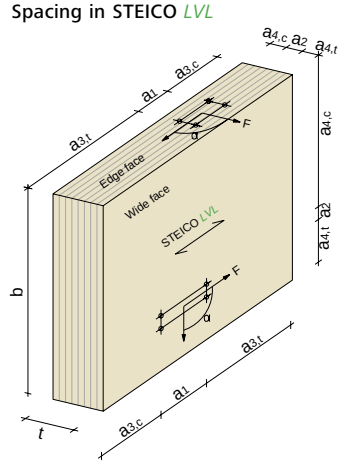
Easy to work with No pre-drilling necessary

Nails, screws and clamps can be inserted into STEICO *LVL* without predrilling, thus fast working progress

Definition of the faces



Spacing in STEICO *LVL*



a_1 Distance parallel to the grain
a_2 Distance perp. to the grain
$a_{3,t}$ Distance to loaded end
$a_{3,c}$ Distance to unloaded end
$a_{4,t}$ Distance to loaded edge
$a_{4,c}$ Distance to unloaded edge
α Angle between force and grain direction

1

Further properties of STEICO *LVL*

The following table summarizes physical and other technical data of STEICO *LVL R* and STEICO *LVL X*

Wood species	STEICO *LVL R*	Pine and/or spruce	FSC® certified (PEFC® on request)	
	STEICO *LVL X*	Pine and/or spruce	FSC® certified (PEFC® on request)	
Average wood moisture content		u = approx. 9%		
Service class		1 and 2		
Bonding of the veneer scarf joints on the board top surface		Melamine Adhesive	Clear glue joint, waterproof	
Bonding of the layers and all other scarf joints		Phenolic Adhesive	Dark glue joint, waterproof	
Release of formaldehyde		0.03 ppm		DIN EN 717-1 and according to QDF♦ – Guideline A 01
Surface quality		Non-vision quality	Structural product	
Thermal conductivity		λ_R= 0.13 W/mK		
Diffusion resistance, air tightness		μ_{wet}= 75 μ_{dry}= 205	Approved as airtight layer	According to DIN 4108-7 Table 6.1.3
Charring rate		β_0= 0.65 mm/min	For panels	According to DIN EN 1995-1-2 Table 3.1
		β_n= 0.70 mm/min	For beams	
Tolerances	Length l	± 5 mm	For all lengths	According to DIN EN 14374:2005-02
	Width b	± 2 mm	b ≤ 400 mm	
		± 0.5 %	b > 400 mm	
	Thickness t	+(0.8+0.03t) -(0.4+0.03t)	For all thicknesses	
Swelling and shrinkage	In % per 1% humidity change below the fiber saturation point			According to DIN EN 1995-1-1/NA Table NA.7 * Internal producer tests
	STEICO *LVL R*	0.01	In veneer longitudinal direction (length)	
		0.32	In veneer cross direction (width/height)	
		0.32*	Perpendicular to the glue line (thickness)	
	STEICO *LVL X*	0.01	In veneer longitudinal direction (length)	
		0.03	In veneer cross direction (width/height)	
		0.32*	Perpendicular to the glue line (thickness)	
Sound insulation	250 Hz to 500 Hz	α = 0.1		According to DIN EN 13986 Table 10
	1000 Hz to 2000 Hz	α = 0.3		
Natural durability against biological attack		4	Durability corresponding to the veneers	DIN EN 350-2
Waste disposal (AVV/EAK)		030105 / 170201	Disposal like wood and wood materials	

♦QDF = Quality consortium of German construction fabrication

Lay-up of STEICO *LVL*

The lay-ups of STEICO *LVL R* and STEICO *LVL X* are shown below. In STEICO *LVL R*, all veneers run parallel.
However, in STEICO *LVL X*, 20% of the veneers are glued cross-wise in transverse direction to the other veneers.

Thickness [mm]	Number of veneer layers	STEICO *LVL R* Lay-up	STEICO *LVL X* Lay-up	STEICO *LVL X* number of cross-layers

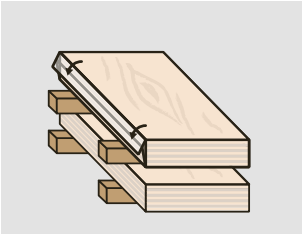
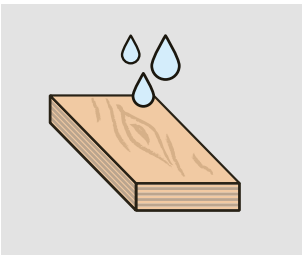
General Information STEICO *LVL*

Storage and transportation



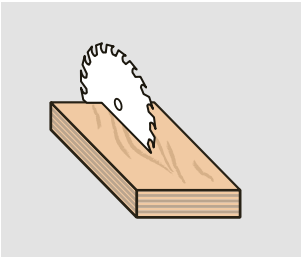
- STEICO *LVL* should be stored flat on bearers and on a dry load bearing surface.
- During Transport, Storage and through the building phase STEICO *LVL* should be protected from moisture (eg stored indoors or covered on site etc.)
- Where the possibility of rain splash back exists STEICO *LVL* should be stored a minimum of 30cm above ground level.
- As with softwood, moisture content levels may vary due to localised climate conditions.
- Care should be taken when walking on protective coverings and packaging due to the risk of slipping.
- Product should be securely stored once removed from original packaging and banding has been removed.
- Standard STEICO *LVL* packs can weigh up to 3 tonnes and therefore suitable lifting and transportation equipment should be used
- Damaged product should not be used.

Directions for use with moisture



- STEICO *LVL* can be used in Service Class 1, 2 & 3. In Service Class 3 chemical additives are required.
- STEICO *LVL* is one of the most dimensionally stable timber products. Moisture content direct from production is approx. 9% and therefore no shrinkage should be expected. However, if subjected to unregulated moisture exposure dimensional variations such as shrinkage or swelling can occur.
- Differentiations in moisture content within single STEICO *LVL* boards can lead to cupping.
- Large format, horizontally laid applications should utilise STEICO *LVL X*
- Standing water as well as long term exposure to direct weathering should be avoided. If exposed to direct weathering localised delamination of the veneers can occur where knots, fissures or scarf joints are present. The top surface of the veneer becomes rougher and unevenness and existing fissures become more apparent. The strength is not effected.
- Moisture contents in LVL should be established using an average result from an oven drying method (EN 322). Standard moisture meters, that measure moisture content via electrical resistance, will not get accurate results for STEICO *LVL*.

Machining and processing



- For handling and cutting of STEICO *LVL*, as with softwood, please use standard wood working tools and machinery along with the appropriate PPE (Personal Protective Equipment).

Notes to the product surface

- Delivered product is unhanded and designed for use as a non-visual construction product.
- Exposure to light can lead to changes in colour as with standard timber products.
- With exposure to increased moisture content the formation of mold is possible as it is with standard softwood.
- For surface coatings the rules and regulations of the surface coating manufacturer should be followed (Sanding, easing of edges, coating thickness etc.).
